## 

## Factorial Experiment:

## Definition:

Let $\mathrm{x}_{1}, \mathrm{x}_{2}, \ldots, \mathrm{x}_{\mathrm{n}}$ are n factors at $\mathrm{s}_{1}, \mathrm{~s}_{2}, \ldots, \mathrm{~s}_{\mathrm{n}}$ levels, the combination of $\mathrm{s}_{1}{ }^{\mathrm{x} 1}, \mathrm{~s}_{2}{ }^{\mathrm{x} 2}, \ldots \mathrm{~s}_{\mathrm{n}}{ }^{\mathrm{xn}}$ called factorial experiment, where this combinations are called treatment combinations.

Factorial experiment are of two types namely,

1) Symmetrical factorial experiment $\left(2^{x *} 2^{y}=2^{x+y}\right)$
2) Asymmetrical factorial experiment $\left(2^{x} * 3^{y}\right)$

## $2^{\mathrm{n}}$ factorial experiment:

## Definition:

If we have n factors and each are at 2 levels, the treatment combinations in a block randomly, then the experiment is called $2^{n}$ symmetrical factorial experiment. $2^{2}$ factorial exper an:
The factors are two namely $A$ and $B$, each are at two levels namely 0 and 1 , so the four possible treatment combinations are,
$\mathrm{a}_{0} \mathrm{~b}_{0}$
1
A
B
$a_{0} b_{1}$
b
0
1
0 1
$a_{1} b_{0}$
a
$a_{1} b_{1}$
ab

## Main effect:

Main effect is defined as average effect of all possible treatment combination at 2 level formed in 2 groups,such that level of 1 factor at each group is same, while level of other factors are different.
4 treatments are,

| $a_{1} b_{1}$ | $a_{0} b_{1}$ |
| :--- | :--- |
| $a_{1} b_{0}$ | $a_{0} b_{0}$ |

$$
a_{1} b_{1}+a_{1} b_{0} \quad a_{0} b_{1}+a_{0} b_{0}
$$

$$
\left[a_{1} b_{1}+a_{1} b_{0}\right] / 2-\left[a_{0} b_{1}+a_{0} b_{0}\right] / 2
$$

2
$\left[a_{1} b_{1}+a_{0} b_{1}\right] / 2-\left[a_{1} b_{0}+a_{0} b_{0}\right] / 2$
$B=$

## eraction effect:

The interaction effect is defined as average of the average of the average effect of all possible treatment combination in $2^{n}$ factorial experiment. Such that level of one factor in each group is same while level of other factors are different.

$$
\left(a_{1} b_{1}-a_{1} b_{0}\right) / 2+\left(a_{0} b_{0}-a_{0} b_{1}\right) / 2
$$

2

$$
\left(a_{1} b_{1}-a_{1} b_{0}\right) / 2-\left(a_{0} b_{1}-a_{0} b_{0}\right) / 2
$$

## 2

## Other defin Main effect:

Main effect is defined as contrast of all possible treatment combinations at two level formed in two groups, such that level of one factor in each group is same, while level of other factors are different.

## Interaction effect:

Interaction effect is defined as contrast of the contrast of all possible treatment combination in 2 factorial experiment, such that level of one factor in each group is same, while level of other factors are different.

## There are three methods to estimate Main effect and Interaction effect:

combinations
contrasts

|  | $A$ | $B$ | $A B$ |
| :--- | :---: | :---: | :---: |
| $a_{0} b_{0}$ | - | - | + |
| $a_{0} b_{1}$ | - | + | - |
| $a_{1} b_{0}$ | + | - | - |
| $a_{1} b_{1}$ | + | + | + |
| $A=-a_{0} b_{0}-a_{0} b_{1}+a_{1} b_{0}+a_{1} b_{1}=\left(a_{1} b_{1}+a_{1} b_{0}\right)-\left(a_{0} b_{1}+a_{0} b_{0}\right)$ |  |  |  |
| $B=-a_{0} b_{0}+a_{0} b_{1}-a_{1} b_{0}+a_{1} b_{1}=\left(a_{0} b_{1}+a_{1} b_{1}\right)-\left(a_{0} b_{0}+a_{1} b_{1}\right)$ |  |  |  |
| $A B=a_{0} b_{0}-a_{0} b_{1}-a_{1} b_{0}+a_{1} b_{1}=\left(a_{1} b_{1}-a_{0} b_{1}\right)-\left(a_{1} b_{0}-a_{0} b_{0}\right)$ |  |  |  |

2) Fisher \& Yate's method:

$$
\begin{aligned}
& A=(a-1)(b+1)=a b-b+a-1 \\
& O R
\end{aligned}
$$

$$
A=\left(a_{1}-a_{0}\right)\left(b_{1}+b_{0}\right)=a_{1} b_{1}+a_{1} b_{0}-a_{0} b_{1}-a_{0} b_{0}
$$

$$
=\left(a_{1} b_{1}+a_{1} b_{0}\right)-\left(a_{0} b_{1}+a_{0} b_{0}\right)
$$

$$
B=\left(b_{1}-b_{0}\right)\left(a_{1}+a_{0}\right)=a_{1} b_{1}+a_{0} b_{1}-a_{1} b_{0}-a_{0} b_{0}
$$

$$
=\left(a_{1} b_{1}+a_{0} b_{1}\right)-\left(a_{1} b_{0}+a_{0} b_{0}\right)
$$

$$
A B=\left(a_{1}-a_{0}\right)\left(b_{1}-b_{0}\right)=a_{1} b_{1}-a_{1} b_{0}-a_{0} b_{1}+a_{0} b_{0}
$$

$$
=\left(a_{1} b_{1}-a_{0} b_{1}\right)-\left(a_{1} b_{0}-a_{0} b_{0}\right)
$$

## 3) Ghosh method:

## Hadmard matrix of size $m$, where $m=2,4,8, \ldots$

i.e. $m=2^{n}$

Take $n=2$;

## Then

$$
H_{4}=\begin{array}{cccc}
1 & 1 & 1 & 1 \\
1 & -1 & 1 & -1 \\
1 & 1 & -1 & -1 \\
1 & -1 & -1 & 1
\end{array}
$$

Delete the first row of Hadmard matrix and write the remaining matrix of $(m-1)$ * $m$ and call H .

$$
H=\begin{array}{rrrr}
1 & -1 & 1 & -1 \\
1 & 1 & -1 & -1 \\
1 & -1 & -1 & 1
\end{array}
$$

Now the treatment combination from right to left,

|  | $a_{1} b_{1}$ | $a_{0} b_{1}$ | $a_{1} b_{0}$ | $a_{0} b_{0}$ |
| :---: | :---: | :---: | :---: | :---: |
| A | 1 | -1 | 1 | -1 |
| B | 1 | 1 | -1 | -1 |
| AB | 1 | -1 | -1 | 1 |

$$
\begin{aligned}
& A=a_{1} b_{1}-a_{0} b_{1}+a 1 b 0-a_{0} b_{0}=\left(a_{1} b_{1}+a_{1} b_{0}\right)-\left(a_{0} b_{1}+a_{0} b_{0}\right) \\
& B=a_{1} b_{1}+a_{0} b_{1}-a_{1} b_{0}-a_{0} b_{0}=\left(a_{1} b_{1}+a_{0} b_{1}\right)-\left(\left(a_{1} b_{0}+a_{0} b_{0}\right)\right. \\
& A B=a_{1} b_{1}-a_{0} b_{1}-a_{1} b_{0}+a_{0} b_{0}=\left(a_{1} b_{1}-a_{0} b_{1}\right)-\left(a_{1} b_{0}-a_{0} b_{0}\right)
\end{aligned}
$$

## ANOVA TABLE OF $2^{2}$ FACTORIAL EXPERIMENT:

| S.V. | d.f. | S.S. | M.s.s. | F-ratio |

| Total | $4(r 1)$ | $\Sigma Y_{\mathrm{ij}}^{2}-\mathrm{CO}-$ TSS |  |  |

An agriculture experiment was conducted at Junagadh agriculture university to find the increase of groundnut of the application of 2 fertilizers of Nitrogen and Potash. Nitrogen was applied as $40 \mathrm{gm} /$ hector and $80 \mathrm{gm} / \mathrm{h}$, while Potash was applied at $50 \mathrm{gm} / \mathrm{h}$ and $100 \mathrm{gm} / \mathrm{h}$. The groundnut seeds were planted in such way that the distance between 2 plants in a row is same. This experiment is conducted in 3 replication. The collected observations of groundnut are shown below.

| Rep-1 | Rep-2 | Rep-3 |
| :---: | :---: | :---: |
| $\mathrm{a}_{0} \mathrm{~b}_{0}(60)$ | $\mathrm{a}_{1} \mathrm{~b}_{1}(79)$ | $\mathrm{a}_{0} \mathrm{~b}_{1}(72)$ |
| $\mathrm{a}_{0} \mathrm{~b}_{1}(70)$ | $\mathrm{a}_{0} \mathrm{~b}_{0}(66)$ | $\mathrm{a}_{0} \mathrm{~b}_{0}(55)$ |
| $\mathrm{a}_{1} \mathrm{~b}_{0}(75)$ | $\mathrm{a}_{0} \mathrm{~b}_{1}(88)$ | $\mathrm{a}_{1} \mathrm{~b}_{0}(69)$ |
| $\mathrm{a}_{1} \mathrm{~b}_{1}(80)$ | $\mathrm{a}_{1} \mathrm{~b}_{0}(100)$ | $\mathrm{a}_{1} \mathrm{~b}_{1}(120)$ |

Analyse the data and give your comments.
$\mathrm{H}_{0}$ :The distance between two plants in a row is same.
Table:

|  | Rep-1 | Rep-2 | Rep-3 | Total |
| :--- | :--- | :--- | :--- | ---: |
| $a_{0} b_{0}$ | 60 | 66 | 55 | 181 |
| $a_{0} b_{1}$ | 70 | 88 | 72 | 230 |
| $a_{1} b_{0}$ | 75 | 100 | 69 | $T_{10}-244$ |
| $a_{1} b_{1}$ | 80 | 79 | 120 | $T_{11}=279$ |
|  | 285 | 333 | 316 | $G=934$ |

C.F. $=G^{2} / \mathrm{N}=(934)^{2} / 12=72696.33$

Total S.S $=\sum Y_{\mathrm{ij}}{ }^{2}-$ C.F. $=3539.67$
Repli.s.s. $=\sum R_{i}^{2} / t-$ C.F. $=296.17$
Now,
$\mathbf{A}=-T_{00}-T_{01}+T_{10}+T_{11}$

$$
=-181-230+244+279=112
$$

s.s. due to $A=[A]^{2} / 4 r=(112)^{2} / 12=1045.33$
$B=$

$$
=230+279-181-244=84
$$

s.s. due to $B=[B]^{2} / 4 r=(84)^{2} / 12=588$
$A B=T_{11}-T_{1}=-14$
s.s. due to $A B=[A B]^{2 / 4 r}=16.333$

| S.V. | d.f. | s.s. | M.s.s. | F-ratio | $F_{t}$ |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :---: |
|  |  |  |  |  | $5 \%$ | $1 \%$ |
| Repli. | $3-1=2$ | 296.17 | 148.085 | 0.5574 | 5.14 | 10.92 |
| Treat. <br> combinatio <br> n | $4-1=3$ |  |  |  |  |  |
| A | 1 | 1045.33 | 1045.33 | 3.9351 | 5.99 | 13.74 |
| B | 1 | 588 | 588 | 2.2135 | 5.99 | 13.74 |
| AB | 1 | 16.333 | 16.333 | 0.0614 | 5.99 | 13.74 |
| Error | 6 | 1593.837 | 265.639 |  |  |  |
| Total | $12-1=11$ | 3539.67 | 321.788 |  |  |  |

For repli.: Fc<Ft (for both level) => test is
insignificant \& we accept our $\mathrm{H}_{0}$.
For main effect $\mathbf{A} \& \mathbf{B}$ and interaction effect $\mathbf{A B}$ : $\mathbf{F c}<\mathbf{F t}$ (for both level) $=>$ test is insignificant \& we accept our $\mathrm{H}_{0}$.

## $2^{3}$ Factorial Experiment:

Let A,B,C are three factors, each are at two levels namely 0 and 1 , so $2^{3}$ possible treatment combinations are,

$$
\begin{aligned}
& a_{0} b_{0} c_{0}
\end{aligned}
$$

$$
\begin{aligned}
& \text { c }
\end{aligned}
$$

$$
\begin{aligned}
& a_{0} b_{1} c_{0} \\
& a_{0} b_{1} c_{1} \\
& a_{1} b_{0} c_{0} \\
& a_{1} b_{0} c_{1} \\
& a_{1} b_{1} c_{0} \\
& a_{1} b_{1} c_{1}
\end{aligned}
$$

## Main effects and Interaction contrasts in $2^{3}$ factorials:

| Combin <br> ations | Main effects and Interactions |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | A | B | C | AB | AC | BC | ABC |
| $\mathrm{a}_{0} \mathrm{~b}_{0} \mathrm{c}_{0}$ | - | - | - | + | + | + | - |
| $\mathrm{a}_{0} \mathrm{~b}_{0} \mathrm{c}_{1}$ | - | - | + | + | - | - | + |
| $\mathrm{a}_{0} \mathrm{~b}_{1} \mathrm{c}_{0}$ | - | + | - | - | + | - | + |
| $\mathrm{a}_{0} \mathrm{~b}_{1} \mathrm{c}_{1}$ | - | + | + | - | - | + | - |
| $\mathrm{a}_{1} \mathrm{~b}_{0} \mathrm{c}_{0}$ | + | - | - | - | - | + | + |
| $\mathrm{a}_{1} \mathrm{~b}_{0} \mathrm{c}_{1}$ | + | - | + | - | + | - | - |
| $\mathrm{a}_{1} \mathrm{~b}_{1} \mathrm{c}_{0}$ | + | + | - | + | - | - | - |
| $\mathrm{a}_{1} \mathrm{~b}_{1} \mathrm{c}_{1}$ | + | + | + | + | + | + | + |

Here,

$$
\begin{aligned}
A & =-a_{0} b_{0} c_{0}-a_{0} b_{0} c_{1}-a_{0} b_{1} c_{0}-a_{0} b_{1} c_{1}+a_{1} b_{0} c_{0}+a_{1} b_{0} c_{1}+a_{1} b_{1} c_{0}+a_{1} b_{1} c_{1} \\
& =\left(a_{1} b_{0} c_{0}+a_{1} b_{0} c_{1}+a_{1} b_{1} c_{0}+a_{1} b_{1} c_{1}\right)-\left(a_{0} b_{0} c_{0}+a_{0} b_{0} c_{1}+a_{0} b_{1} c_{0}+a_{0} b_{1} c_{1}\right)
\end{aligned}
$$

$$
\begin{aligned}

## $3^{n}$ Factorial Experiment:

## Definition:

If we have n factors and each are at 3 levels, then the treatment combinations in a block randomly then the experiment is called $3^{n}$ symmetrical factorial experiment.

* when factors are taken at 3 levels instead of 2 , the scope of the experiment increases.It becomes more informative. Further, when the levels of a factor are quantitative, the pattern of change of response with the increase of the level values of the factor can be studied in a better way. A study to investigate if the change is linear or quadratic is possible when the factors at 3 levels, though from this point of view the more the number of levels the better.

## $3^{2}$ Factorial Experiment:

Let there are two factors $N$ and $P$, each are at 3 levels namely 0,1 , and 2 .

All possible combinations are,
$\mathrm{n}_{0} \mathrm{p}_{0}$
$n_{1} p_{0}$
$\mathrm{n}_{2} \mathrm{p}_{0}$
$\mathrm{n}_{0} \mathrm{p}_{1}$
$n_{1} p_{1}$
$\mathrm{n}_{2} \mathrm{p}_{1}$
$\mathrm{n}_{0} \mathrm{p}_{2}$
$n_{1} p_{2}$
$\mathrm{n}_{2} \mathrm{p}_{2}$

## Method 1:

In $3^{2}$ factorial experiment, there are two types of Main effect namely,

1) Linear Main effect
2) Quadratic Main effect

The contrast $\mathrm{N}_{2}-\mathrm{N}_{0}$ gives the linear contrast among the three levels of N , if they are equispaced. It indicates a linear relation between the response and level values of N . The other contrast, $\mathrm{N}_{2}-2 \mathrm{~N}_{1}+\mathrm{N}_{0}$. This contrast indicates a quadratic relation between the levels and their responses.
Now,

$$
\begin{aligned}
\mathrm{N}_{\mathrm{L}} & =\mathrm{N}_{2}-\mathrm{N}_{0} \\
& =\left(n_{2} p_{0}+n_{2} p_{1}+n_{2} p_{2}\right)-\left(n_{0} p_{0}+n_{0} p_{1}+n_{0} p_{2}\right) \\
\mathrm{N}_{\mathrm{Q}} & =N_{2}-2 N_{1}+N_{0} \\
& =\left(n_{2} p_{0}+n_{2} p_{1}+n_{2} p_{2}\right)-2\left(n_{1} p_{0}+n_{1} p_{1}+n_{1} p_{2}\right)+\left(n_{0} p_{0}+n_{0} p_{1}+n_{0} p_{2}\right)
\end{aligned}
$$

$$
\begin{aligned}
P_{L}= & P_{2}-P_{0}=\left(p_{2} n_{0}+p_{2} n_{1}+p_{2} n_{2}\right)-\left(p_{0} n_{0}+p_{0} n_{1}+p_{0} n_{2}\right) \\
P_{Q}= & P_{2}-2 P_{1}+P_{0} \\
= & \left(p_{2} n_{0}+p_{2} n_{1}+p_{2} n_{2}\right)-2\left(p_{1} n_{0}+p_{1} n_{1}+p_{1} n_{2}\right)+\left(p_{0} n_{0}+p_{0} n_{1}+p_{0} n_{2}\right) \\
N_{L} P_{L}= & \left(N_{2}-N_{0}\right)\left(P_{2}-P_{0}\right) \\
= & {\left[\left(n_{2} p_{0}+n_{2} p_{1}+n_{2} p_{2}\right)-\left(n_{0} p_{0}+n_{0} p_{1}+n_{0} p_{2}\right)\right] } \\
& {\left[\left(p_{2} n_{0}+p_{2} n_{1}+p_{2} n_{2}\right)-\left(p_{0} n_{0}+p_{0} n_{1}+p_{0} n_{2}\right)\right] } \\
N_{L} P_{Q}= & \left(N_{2}-N_{0}\right)\left(P_{2}-2 P_{1}+P_{0}\right) \\
= & {\left[\left(n_{2} p_{0}+n_{2} p_{1}+n_{2} p_{2}\right)-\left(n_{0} p_{0}+n_{0} p_{1}+n_{0} p_{2}\right)\right] } \\
& {\left[\left(p_{2} n_{0}+p_{2} n_{1}+p_{2} n_{2}\right)-2\left(p_{1} n_{0}+p_{1} n_{1}+p_{1} n_{2}\right)+\left(p_{0} n_{0}+p_{0} n_{1}+p_{0} n_{2}\right)\right] } \\
N_{Q} P_{L}= & \left(N_{2}-N_{1}+N_{0}\right)\left(P_{2}-P_{0}\right) \\
= & {\left[\left(n_{2} p_{0}+n_{2} p_{1}+n_{2} p_{2}\right)-2\left(n_{1} p_{0}+n_{1} p_{1}+n_{1} p_{2}\right)+\left(n_{0} p_{0}+n_{0} p_{1}+n_{0} p_{2}\right)\right] } \\
& {\left[\left(p_{2} n_{0}+p_{2} n_{1}+p_{2} n_{2}\right)-\left(p_{0} n_{0}+p_{0} n_{1}+p_{0} n_{2}\right)\right] } \\
N_{Q} P_{L}= & \left(N_{2}-N 1+N_{0}\right)\left(P_{2}-2 P_{1}+P_{0}\right) \\
= & {\left[\left(n_{2} p_{0}+n_{2} p_{1}+n_{2} p_{2}\right)-2\left(n_{1} p_{0}+n_{1} p_{1}+n_{1} p_{2}\right)+\left(n_{0} p_{0}+n_{0} p_{1}+n_{0} p_{2}\right)\right] } \\

## $3^{3}$ Factorial Experiment:

Let there are three factors $N$ and $P$ and $K$, each are at 3 levels namely 0,1 , and 2 .
$\frac{\mathrm{N}}{0}$

All possible combinations are,

| $n_{0} p_{0} k_{0}$ | $n_{1} p_{0} k_{0}$ | $n_{2} p_{0} k_{0}$ |
| :--- | :--- | :--- |
| $n_{0} p_{0} k_{1}$ | $n_{1} p_{0} k_{1}$ | $n_{2} p_{0} k_{1}$ |
| $n_{0} p_{0} k_{2}$ | $n_{1} p_{0} k_{2}$ | $n_{2} p_{0} k_{2}$ |
| $n_{0} p_{1} k_{0}$ | $n_{1} p_{1} k_{0}$ | $n_{2} p_{1} k_{0}$ |
| $n_{0} p_{1} k_{1}$ | $n_{1} p_{1} k_{1}$ | $n_{2} p_{1} k_{1}$ |
| $n_{0} p_{1} k_{2}$ | $n_{1} p_{1} k_{2}$ | $n_{2} p_{1} k_{2}$ |
| $n_{0} p_{2} k_{0}$ | $n_{1} p_{2} k_{0}$ | $n_{2} p_{2} k_{0}$ |
| $n_{0} p_{2} k_{1}$ | $n_{1} p_{2} k_{1}$ | $n_{2} p_{2} k_{1}$ |
| $n_{0} p_{2} k_{2}$ | $n_{1} p_{2} k_{2}$ | $n_{2} p_{2} k_{2}$ |

## Method 1:

In $3^{2}$ factorial experiment, there are two types of Main effect namely,

1) Linear Main effect
2) Quadratic Main effect

The contrast $\mathrm{N}_{2}-\mathrm{N}_{0}$ gives the linear contrast among the three levels of $N$, if they are equispaced. It indicates a linear relation between the response and level values of N . The other contrast, $\mathrm{N}_{2}-2 \mathrm{~N}_{1}+\mathrm{N}_{0}$. This contrast indicates a quadratic relation between the levels and their responses.
Now,

$$
\begin{aligned}
\mathrm{N}_{\mathrm{L}}= & \mathrm{N}_{2}-\mathrm{N}_{0} \\
= & \left(n_{2} p_{0} k_{0}+n_{2} p_{0} k_{1}+n_{2} p_{0} k_{2}+n_{2} p_{1} k_{0}+n_{2} p_{1} k_{1}+n_{2} p_{1} k_{2}+n_{2} p_{2} k_{0}+n_{2} p_{2} k_{1}+n_{2} p_{2} k_{2}\right)- \\
& \left(n_{0} p_{0} k_{0}+n_{0} p_{0} k_{1}+n_{0} p_{0} k_{2}+n_{0} p_{1} k_{0}+n_{0} p_{1} k_{1}+n_{0} p_{1} k_{2}+n_{0} p_{2} k_{0}+n_{0} p_{2} k_{1}+n_{0} p_{2} k_{2}\right)
\end{aligned}
$$

$$
N_{Q}=N_{2}-2 N_{1}+N_{0}
$$

$=\left(n_{2} p_{0} \mathrm{k}_{0}+\mathrm{n}_{2} \mathrm{p}_{0} \mathrm{k}_{1}+\mathrm{n}_{2} \mathrm{p}_{0} \mathrm{k}_{2}+\mathrm{n}_{2} \mathrm{p}_{1} \mathrm{k}_{0}+\mathrm{n}_{2} \mathrm{p}_{1} \mathrm{k}_{1}+\mathrm{n}_{2} \mathrm{p}_{1} \mathrm{k}_{2}+\mathrm{n}_{2} \mathrm{p}_{2} \mathrm{k}_{0}+\mathrm{n}_{2} \mathrm{p}_{2} \mathrm{k}_{1}+\mathrm{n}_{2} \mathrm{p}_{2} \mathrm{k}_{2}\right)^{-}$ $2\left(n_{1} p_{0} k_{0}+n_{1} p_{0} k_{1}+n_{1} p_{0} k_{2}+n_{1} p_{1} k_{0}+n_{1} p_{1} k_{1}+n_{1} p_{1} k_{2}+n_{1} p_{2} k_{0}+n_{1} p_{2} k_{1}+n_{1} p_{2} k_{2}\right)$ $+\left(n_{0} p_{0} k_{0}+n_{0} p_{0} k_{1}+n_{0} p_{0} k_{2}+n_{0} p_{1} k_{0}+n_{0} p_{1} k_{1}+n_{0} p_{1} k_{2}+n_{0} p_{2} k_{0}+n_{0} p_{2} k_{1}+n_{0} p_{2} k_{2}\right)$

$\mathrm{K}_{\mathrm{L}}=\mathrm{K}_{2}-\mathrm{K}_{0}$

## Importance of Factorial Experiment:

1) ficiency of factorial experiment is 2) Givvan informafion
2) The resuls of factoriall expe facto of factors and
optimum
Limits: large then the no. of possible treatment cor sinations is very laroe $\Rightarrow$ the variance $\sigma^{2}$ is inc ease $=>$ efficiency is crease.
